

## Square Size Mode(Video Player)

When direction of Longer side of W or H of video is not consistent with screen's longer side one, too small size for whole portion of video seen or too large area of video removed for adequate size, for example, in case that you see a movie at phone portraited(vertically).

With your phone in landscape, you can get full area of movie, but might get poor-Handling and lack of stability.

In many cases in Portrait state, Too small in width-base and too large in Height-base.

So 'Square' mode added in which you get some adequate size video although with lack of some portion of video.

---

### Square Auto ON

---

Under 'Square Auto' is ON, 'square' mode is available and selectable(in double-tap) or adopted automatically when inconsistency occurs in video and screen long-side directions as above, not always.

With phone portraited, in almost cases 'square' mode appear. Otherwise with landscape, appear only for vertically-long video playback. So in landscape, double-Tap almost go around in 'Width-base' and 'Height-base', seldom 'Square'.

Adjustment:

0.8-1.2 values available for Height ratio to Width in video section of Preference.

Playback in Playlist:

When go to Next title, if Square mode applicable(in above case) ,video displayed in Square mode automatically.
