
Start Video Player

In default, Clicking Video file starts Video Player.

*In default, if Maximized in previous VideoPlayer closed, VideoPlayer opened in Maximized(since Ver.85).

But If Music Player is ON(and Video Player is 'OFF'), Clicking Video file Opens Video with Music Player

('Open with Video Player' item is shown in Menu by Long-Clicking video file).

If both Music and Video Player are ON, Clicking Video file open video file with Video Player(Item 'Open with Music Player' is shown in Menu by Long-Clicking video file).

. * When 'Playlist includes Movie Files =No' selected in MusicPlayer setting(in Preference), Video file is always opened with Video Player whether Music Player is Open or not, and can't playback Video file in background with Music Player.

Video Size(Size Mode)

In default, video size is adjusted to show whole area of video within player and video's Width or Height be fit to Video Pane's Width or Height(Width-Base and Height-Base).

+Double Tap, changes Size Mode between 'Height-Base'<=>'Width-Base'.

When video zoomed or Panned, Recover default size by Double-Tap.

+Size Mode is memorized for each direction during App living.

+When Video Pane Border dragged and moved, only if under Height-Base(or Width-Base) mode, mode effect sustained following player size change. If the video has been Zoomed or Panned manually by Pinch Or Swipe, base mode is broken and not adjusted automatically following Border.

Single Tap

shows All bars.

*This Operation is different from Floating Window Maximized for showing Bar.

(In floating Window, Vertical-Down-Swipe shows Bar. Because in case of Web page in Floating Window Maximized, tap might open Link on Web Page, while in Video player Screen-Swipe causes Pan of video)

ComboBox bar(Upper)

<Spd> ComboBox

Changes Playback Speed

<Op> ComboBox

+ Mute in Slow:

Except Normal-Speed,Mute is ON.

+Keep Ratio :

Some Videos might not shown with proper Width-Height ratio in default. If so, Set 'Keep Ratio' to OFF. You can Zoom in arbitrary ratio.

(After that, Set 'Keep Ratio' back to ON and you can do your adjusted-ratio Zoom Operation)

+Keep Size Mode :

When you go Previous or Next video, Size Mode sustained.

This feature work only when Size mode is under 'Height-Base' or 'Width-Base'.

When you Zoom or Pan video, Width(or Height)-Base mode is broken and the next video will be adjusted to show whole part of video(in default action).

+Repeat Between A-B :

Under Playback, Select Repeat A(menu changes 'Repeat B') then select 'Repeat B'('B' is need to be later time than 'A' in the same Video).

To cancel repeating, select 'Repeat Clear'(after selecting 'Repeat B')

<Bar> ComboBox

+Player Position :

You can select location of video player in Top or Side(Left).

* This is intended for foldable phone (Locate player on Left side window in Portrait mode or on Upper window in Landscape with layed lower Window on your table)

+Bars Show/Hide :

For each Case Maximized or Not Maximized, there are settings.

Operation Button (Lower)

<Fast Forward and Rewind Button>

Click or Continue clicking-down.

These Speed are different depending on whether video is under Playing ,Paused and in Slow motion.And these are not depned on Video duration Time (this is more useful for finding scene). To skip long-range, use seek bar.

Under video Paused, this feature show only Key-Frame not all frames(To see all frame in Slow, use speed-change as x0.1 or x0.3 etc).

*Under Slow Motion(Low speed selected and playing(not Paused)), progress time by Fast Forward and Rewind Button is lower and not fixed span than that of Normal Speed Playback.(Since Ver.82-)

* Other buttons are basically same as 'Music' Player.

* When you move to other directry using Tree Pane under Video Playing, playlist not change as long as you don't click video file in new folder. So by Clicking Next and Previous button, you go to a file in folder where now video playbacted. Otherwise Clicking video file in new folder makes new playlist using new folder.

* Music Player playlist and Video Player playlist are another things. Each can be for different folders.

Others:

Non-Official Feature:

Video File can be open from File-Search Result(by Extension Search using 'mp4' etc.).
This is not official feature(Not implemented fully for that). But for some purpose,it may be useful(and interesting).

- * Use in Portrait mode(In landscape,video pane cannot be seen).
- * Playlist is based on currently played video file's location. So Prev/Next Button traverse folder that file belongs to , not over Search-Result.

Bug as to Speed :

When return from background(Ex: Press such as Android Home key while video watching, then return to this App), Video Speed operation not work. Please press Next/Prev buttons or select-click the video file again.

CAUTION:

+ Video Player not work background or under phone locked. If you would like to listen only Audio of 'Video' file background, you can playback 'Video' file with 'Music' Player(need to set 'Playlist includes Movie Files =YES' in MusicPlayer setting at Preference).

When Music player is ON(and VideoPlayer OFF), by simply clicking 'Video' file you can playback video on Music Player. If not so, Long-click 'Video' file and select 'Play on Music Player' in Menu shown.

* When cannot playback video file on 'Video Player' because of Video Format, in some case Only audio playback is possible on 'Music Player'.

+ Some Videos can playbacked but only Audio played without picture in Video Player(App crashes at the worst case).

+ Some format such as MOV,WMV etc. cannot basically played with Android Media Player. So in case of these some format, basically reject them and shows external App selection.

+ High Resolution Video playback etc. might cause lacking of resources and unexpected action(ex.Skip-Next,View Area not extended fully, sudden playback starting only with

clicking tree folder, or so). In that case, try turning off file thumbnail and use simple file list.

+ Cannot Playback Streaming Video.

+On Android 5,6, features of Speed-change and Zoom not work properly.
